A function whose value is either true or false is called a predicate. In LISP, the values true and false are represented by the atomic symbols T and F, respectively. A LISP predicate is therefore a function whose value is either T or F. The predicates is a test for equality on atomic symbols. It is undefined for non- atomic arguments .

For users coming to Cambridge LISP from other dialects of LISP, your attention is drawn to the following points: 1. Function definition is performed with the functions `de` or `df`; 2. The function associated with an identifier is its value; 3. The distinct value and function definition cells of other LISP dialects are not supported. 1.3 Running LISP

Scheme is a minimalist dialect of the Lisp family of programming languages. Scheme consists of a small standard core with powerful tools for language extension. Scheme was created during the 1970s at the MIT AI Lab and released by its developers, Guy L. Steele and Gerald Jay Sussman, via a series of memos now known as the Lambda Papers. It was the first dialect of Lisp to choose lexical scope ...
