Hypotension and bradycardia are common adverse effects following spinal anesthesia. Ondansetron has been studied in the attenuation of spinal anesthesia-induced hypotension (SIH) and bradycardia because of its antagonistic effect on the Bezold-Jarisch reflex. The purpose of this systematic review and meta-analysis of randomized controlled trials (RCTs) was to determine the efficacy of intravenous (IV) ondansetron in reducing the incidence of SIH and bradycardia.

Mowrer and Klein have long been making contributions to the field of contemporary learning theories. Their first two-volume set included chapters authored by many of the leading researchers in the field of animal learning and focused primarily on Pavlovian theory and instrumental conditioning. These impartial texts were an important addition to the field and remain widely cited. Over the last decade research on the nature of the learning process has evolved considerably. The research in this new volume represents the cutting-edge contributions of first rate authors and co-authors. These 14 chapters deal with the theoretical perspectives concerning the nature of the learning process, as well as the innovative research that supports these positions. This text is bound to be invaluable to both students and faculty of psychology and related disciplines, as well as to outside scholars. Key features include: * an introductory chapter describing general theories of learning and the causes of the shift to more specific, contemporary theories; * five chapters detailing the research and theories of the nature of Pavlovian Conditioning; * four chapters dealing with the current thinking and research on the nature of instrumental operant conditioning; * three chapters describing the link between learning and physiology; and * a concluding chapter detailing the application of learning theory to abnormal psychology.

Provides a contemporary focus on the research, theory, and clinical application concerning conditioned taste aversion effects and methodology, and serves as a definitive perspective on the current state of research in this area.

The study of learning and memory is a central topic in neuroscience and psychology. Many of the basic research findings are directly applicable in the treatment of diseases and aging phenomena, and have found their way into educational theory and praxis. Concise Learning and Memory represents the best 30 chapters from Learning and Memory: A comprehensive reference (Academic Press March 2008), the most comprehensive source of information about learning and memory ever assembled, selected by one of the most respective scientists in the field, John H. Byrne. This concise version provides a truly authoritative collection of overview articles representing fundamental reviews of our knowledge of this central cognitive function of animal brains. It will be an affordable and accessible reference for scientists and students in all areas of neuroscience and psychology. The study of Learning and Memory is a central topic in Neuroscience and Psychology. It is also a very good example of a field that has come into maturity on all levels - in the protein chemistry and molecular biology of the cellular events underlying learning and memory, the properties and functions of

neuronal networks, the psychology and behavioural neuroscience of learning and memory. Many of the basic research findings are directly applicable in the treatment of diseases and aging phenomena, and have found their way into educational theory and praxis. *Learning and Memory: A Comprehensive Reference* is the most comprehensive source of information about learning and memory ever assembled, and the definitive reference work on the topic. In four volumes, Editor-in-Chief John H. Byrne (University of Texas), together with volume editors Howard Eichenbaum (Boston University) for Systems and Neuroscience, Randolph Menzel (Freie Universität Berlin) for Behavioral Approaches, Henry Roediger (Washington University) for Cognitive Psychology, and David Sweatt (University of Alabama, Birmingham) for Molecular Mechanisms, have put together a truly authoritative collection of overview articles in 159 chapters on over 3000 pages. *Learning and Memory: A Comprehensive Reference* presents an extensive, integrated summary of the present state of research in the neurobiology and psychology of learning and memory and covers an enormous range of intellectual territory. With topics ranging from the neurochemistry and neurobiology of learning at the cellular and synaptic levels, systems neurobiology, the study of remarkable capabilities in animals (such as homing), ethological and behavioristic analyses, mechanisms, psychology, and disorders of learning and memory in humans, the work broadly covers all topics in the neurobiology and psychology of learning and memory. There is no other handbook with such a comprehensive coverage and depth. The authors selected are the leading scholars for the particular topics on which they write. The most comprehensive and authoritative resource available on the topic of learning and memory and its mechanisms. Representing outstanding scholarship, each chapter is written by a leader in the field and an expert in the topic area. Relevant and useful for newcomers and advanced researchers alike. All topics represent the most up to date research. A must have set for all medical, neuroscience and psychology libraries, and of great value to neighbouring disciplines, including education.
