Japanese Kampo Medicines for the Treatment of Common Diseases - Focus on Inflammation provides researchers and clinicians with a current look at how Kampo medicines can be used to effectively treat inflammatory disorders. Japanese Kampo medicines are a mixture of natural and herbal medicines that are available in Japan for the treatment of various diseases. Given their therapeutic potential, they are often prescribed instead of, or alongside, allopathic medicines. Kampo medicines are becoming more widespread and have proven effective for the treatment of a variety of inflammatory diseases, such as colitis, dermatitis, myocarditis, hepatitis, cardiomyopathy, and nephritis. This book offers background on Japanese Kampo medicines, along with a compilation of the published scientific data for several different types of Kampo medicines. It is an evidence-based guide for all those involved in, or interested in, the research and practice of Kampo medicine. Includes both preclinical and clinical data published from a variety of sources and compiled into one book Provides insight for researchers and clinicians on which Kampo medicines will provide the least side effects and offer the most effective therapy for a particular illness Offers important data that will help to inform future research and widen practice in this area

Before new interventions can be used in disease control programmes, it is essential that they are carefully evaluated in "field trials", which may be complex and expensive undertakings. Descriptions of the detailed procedures and methods used in trials that have been conducted in the past have generally not been published. As a consequence, those planning such trials have few guidelines available and little access to previously accumulated knowledge. In this book the practical issues of trial design and conduct are discussed fully

and in sufficient detail for the text to be used as a "toolbox" by field investigators. The toolbox has now been extensively tested through use of the first two editions and this third edition is a comprehensive revision, incorporating the many developments that have taken place with respect to trials since 1996 and involving more than 30 contributors. Most of the chapters have been extensively revised and 7 new chapters have been added.

The evaluation of reproductive, maternal, newborn, and child health (RMNCH) by the Disease Control Priorities, Third Edition (DCP3) focuses on maternal conditions, childhood illness, and malnutrition. Specifically, the chapters address acute illness and undernutrition in children, principally under age 5. It also covers maternal mortality, morbidity, stillbirth, and influences to pregnancy and pre-pregnancy. Volume 3 focuses on developments since the publication of DCP2 and will also include the transition to older childhood, in particular, the overlap and commonality with the child development volume. The DCP3 evaluation of these conditions produced three key findings: 1. There is significant difficulty in measuring the burden of key conditions such as unintended pregnancy, unsafe abortion, nonsexually transmitted infections, infertility, and violence against women. 2. Investments in the continuum of care can have significant returns for improved and equitable access, health, poverty,

and health systems. 3. There is a large difference in how RMNCH conditions affect different income groups; investments in RMNCH can lessen the disparity in terms of both health and financial risk.
